

w15-p1: finish search form

The screenshot shows two windows. On the left is the VS Code editor with the file `searchForm_91.js` open. The code defines a form and an input field, and sets up an event listener for the 'keyup' event. The event listener calls `presentDrinks` with the current value of the input field. On the right is a web browser showing the 'Cocktails API' page. The search input field contains the text 'apple'. The browser's developer tools show the console output, which includes the array of drinks returned by the API for the search term 'apple'.

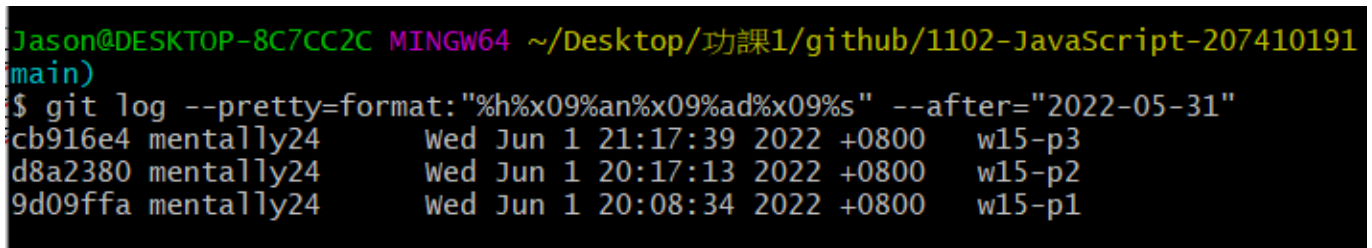

w15-p2: Get data-id of a drink, save to local storage

The screenshot shows two windows. On the left is the VS Code editor with the file `setDrink_91.js` open. The code defines a `setDrink` function that takes a section as an argument. It adds an event listener to the section that calls `setDrink` when clicked. The function then logs the data-id of the clicked element and saves it to local storage using `localStorage.setItem`. On the right is a web browser showing the 'Cocktails API' page. The search input field contains the text 'apple'. The browser's developer tools show the console output, which includes the array of drinks returned by the API for the search term 'apple'. The 'drinks' array is highlighted, showing the data-id of the first drink, 17833.

w15-p3: Get drink info based on data-id, and show the data
